

Next Generation BIM Coordination

Revizto is a real-time, 3D model based issue tracking software for AEC teams with a focus on collaboration and BIM project coordination.

Revizto uses gaming technology and cloud solutions to bring together various building design environments and BIM/CAD workflows into a single, navigable view. The result solves real-world problems in architecture, engineering, construction, and facility management. The Revizto platform is intuitive, easy-to-learn and adaptable to your workflow. With Revizto, BIM implementation is streamlined, allowing teams to speak a common language and share a single window into all project information.

Revizto is fully compatible with

Revit

Navisworks

AutoCAD

Civil 3D

SketchUp

ArchiCAD

Supported file formats

FBX

IFC

BCF

PDF

DWF

Seamless integration with your workflow

Export in minutes

Bring your BIM project into a navigable 3D environment in minutes. All BIM object data and linked files will be preserved.

2D Sheets: Export 2D Sheets from your model as well as all of the linked sheets. They will be available for further viewing and collaboration in Revizto. You can also import PDF and DWF.

Export scheduler: Schedule your export overnight, and Revizto will launch Revit or Navisworks and export your selected model directly onto the cloud keeping all parties up-to-date.

Share instantly

Once converted, upload your Revizto model to the Revizto Cloud and instantly share it with anyone on the project team.

Sync: Cloud Revizto projects are easily synchronized after each model export from the original program.

User access management: You can configure different access levels for each member of the project separately.

Revision control: After each sync, a new revision is created on the cloud. You can roll back to any revision at any time.

Present and explore in VR

Accurately convey your design as if it has been already built.

VR ready: Revizto works natively with Oculus and HTC Vive and instantly creates an explorable, true-to-scale VR experience in seconds.

Camera share: Invite your team and clients to an online tour. They'll see exactly what you want them to see, with zero delay.

Combined view: Use combined view to get better understanding of the model: simply overlay a sheet on top of the 3D.

Collaborate in real time

Keep track of everything that is going on in your project. Identify, track, and solve problems throughout all phases of the project.

Issue Tracker: A simple yet powerful task tracking system, allows teams to collaborate on cloud projects in real time – assign issues, generate reports, manage project activities in one place everyone has access to.

Markup tool: Explain a problem with a simple visual language. Each issue contains a markup bringing plenty of options to help you convey your thoughts and ideas on a model or sheets in a clear comprehensive way.

Clashes from Navisworks: Import your clashes directly to the Issue Tracker, keep tracking them in Revizto or Revit. Imported clashes will appear alongside all other project issues, making it easier to track everything in one place.
