

FAB119043

Advance Steel for BIM: Seamless Workflow from Design to Fabrication

Deepak Maini
Cadgroup Australia

Learning Objectives

- Learn how to export a Revit Structure model and import it into Advance Steel
- Learn how to create automated steel connections between the members imported from Revit
- Learn how to generate automated fabrication drawings and NC files
Learn how to use Sync to review and import any Revit changes into Advance Steel or validate Advance Steel model in Revit

Description

To maintain competitive advantage, more and more structural engineers are trying to find a way to capitalize on their Building Information Modeling (BIM) data for steel detailing and fabrication. This class will explore how Advance Steel detailing software is proving to be the missing link that lets structural engineers capitalize on their Revit Structure models for steel detailing and fabrication. You will also learn how to use Connection Vault in Advance Steel to create automated steel connections on structural members imported from Revit software. You will then learn how to create the automated fabrication and erection drawings and NC files. This class will also show how the bidirectional sync between Revit and Advance Steel lets you bring any Revit changes into Advance Steel software or validate Advance Steel models in Revit software.

Speaker

Deepak is a qualified Mechanical Engineer with more than 18 years of experience of working in the design industry. He is currently working as the National Technical Manager - Named Accounts, with Cadgroup Australia. Deepak is also a guest lecturer at the University of Technology Sydney (UTS) and University of New South Wales (UNSW), two of the biggest universities in Australia.

He is the author of the [Up and Running with Autodesk Advance Steel](#) and [Up and Running with Autodesk Navisworks](#) series of textbooks. Visit the Authored Textbook page of his website www.deepakmaini.com to know about these books.

Deepak is a regular speaker at Autodesk University in Las Vegas and is one of the [Top Rated Speakers](#) for last three years in a row. At AU2016, he was also one of the [Top Rated Online Speakers](#). He was recently rated among the [Top Three Speakers](#) at BILT ANZ Conference and [Top Six Speakers](#) at BILT Asia Conference.

Introduction to Autodesk Advance Steel

Autodesk Advance Steel is purpose-built software for structural engineers and steel detailers. Running on the AutoCAD platform, this software caters to the needs of the BIM and Plant/Mining industries by providing specialized tools to automate the process of creating complex structural models and connections. It also increases the user productivity by automatically generating detailed fabrication and shop drawings, reports, bill of materials (BOM), and NC/DSTV files for steel cutting.

Figure 1 shows a part of the Elevation Tower created for the mining industry.

FIGURE 1: STRUCTURAL STEEL MODEL CREATED FOR THE MINING INDUSTRY

While working with Building Information Modeling (BIM) data, Autodesk Advance Steel has bidirectional workflows with Autodesk Revit. Using the Autodesk Advance Steel add-in for Autodesk Revit, you can directly import Autodesk Revit models into Autodesk Advance Steel for creating connections and generating detailed documentation. You can also import Autodesk Advance Steel models into Autodesk Revit for design verification. Figure 2 shows a structural steel model created in Autodesk Revit and imported into Advance Steel. The model used in the class demonstration was a section of this model.

FIGURE 2: A STRUCTURAL STEEL MODEL CREATED IN AUTODESK REVIT AND IMPORTED INTO ADVANCE STEEL

Downloading the Advance Steel 2018 Extension for Revit

To be able to export the Revit Structure model for importing in Advance Steel, you need to download and install the **Advance Steel Extension**. The following section shows how to download this extension.

1. From the Revit software, click on the **Exchange Apps** button, as shown in Figure 3.

FIGURE 3: THE **EXCHANGE APPS** BUTTON

2. On the Exchange Apps store, search for **Advance Steel 2018 Extension**. It is a free Add-In for the Autodesk Subscription customers, as shown in Figure 4.

Advance Steel 2018 Extension
Autodesk, Inc.
★★★★★ (0 review)

OS: Win64
Language: English

Description

With Advance Steel 2018 Extension, Autodesk® Revit® 2018 users can quickly connect their models to Advance Steel 2018 using the export, import and synchronize functionalities to transfer the BIM data in LOD350 for Structural Steel. This interoperability helps users to produce general arrangement drawings, fabrication drawings, BOMs, and NC files for steel structures more rapidly. Users can update the modifications without the need to reimport the entire structure using BIM data synchronization between applications. Synchronization also reduces the risk of potential errors by offering the possibility to track changes made on the same model in different applications.

Using Advance Steel 2018 Extension, the BIM data from the Revit model can be imported or exported also in other formats such as SDNF (Version 2.0 and Version 3.0), CIS2 Fabrication and PSS.

FIGURE 4: THE **ADVANCE STEEL 2018 EXTENSION**

3. Download and install this add-in. You will have to close Autodesk Revit before installing this.
4. After the add-in is installed, it will be listed in the **Add-Ins** tab, as shown in Figure 5.

FIGURE 5: THE **ADVANCE STEEL EXTENSION** ADD-IN

Exporting Revit Structure Models

Now that you have installed the Advance Steel add-in, you are ready to export the Revit Structure model to be imported into Advance Steel. The recommended format for exporting the Revit Structure model is SMLX format (Steel Markup Language). However, it is a good idea to first check the export settings to make you the right content gets exported. The following section explains how to configure the export settings and then export the model.

1. From the **Add-Ins** tab > **Advance Steel Extension** flyout, click **Settings**; the **Settings** dialog box is displayed, as shown in Figure 6.

FIGURE 6: THE **SETTINGS** DIALOG BOX

2. Clear the **Export beams shortenings** tick box. This will ensure the beam shortenings created inside Autodesk Revit is not exported. This is because the beams will automatically be shortened while creating connections in Advance Steel.
3. Select the **Export only structure elements** tick box if you do not want to export elements such as concrete slabs, footings, etc.
4. Click **OK** in the dialog box.

*Tip: Before exporting the model, you need to find if you want to export the entire model, or the selected items from the model. If you want to export the entire model, you do not need to select anything before exporting. The entire model will be automatically selected for exporting. However, if you want to export only some items from the model, you need to select those items first from the Autodesk Revit window before you invoke the **Export** tool.*

5. From the **Add-Ins** tab > **Advance Steel Extension** flyout, click **Export**; the **Export utilities** dialog box is displayed, as shown in Figure 7.

FIGURE 7: THE **EXPORT UTILITIES** DIALOG BOX

6. By default, the **Advance export** radio button is selected. This will ensure the model is exported in the SMLX format. Click the **OK** button; the **Save As** dialog box is displayed prompting you to specify the name and location of the SMLX file.
7. Specify the name and location of the SMLX file and then click **Save** in the dialog box.

Importing the Model into Advance Steel

Once you have exported the SMLX file from Autodesk Revit, you are ready to import it into Advance Steel. The following section shows how to do that.

1. Start Autodesk Advance Steel.
2. From the **Export & Import** ribbon tab > **Revit** ribbon panel, click **Import**; as shown in Figure 8.

FIGURE 8: IMPORTING THE SMLX FILE FROM AUTODESK REVIT

3. In the **Open** dialog box, browse and select the SMLX file that was saved from Autodesk Revit. If mapping of structure members or material is required, a dialog box will be displayed, as shown in Figure 9.

FIGURE 9: THE **MATERIAL CONVERSION** DIALOG BOX

4. Once the section and material mapping is completed, the model will be opened in Advance Steel, as shown in Figure 10.

FIGURE 10: AUTODESK REVIT STRUCTURE MODEL OPENED IN ADVANCE STEEL

Adding Connections to the Steel Model

In Advance Steel, the **Connection Vault** palette provides you various connection types to join structural members together. This palette comprises of four sections. Various types of connections categories are organized in the toolbar format on the left side of this palette, labeled as **1** in Figure 11. When you pick a tool button for a connection category, all the available connection types for that category are displayed in the middle section of this palette, labeled as **2**. The upper right section, labeled as **3**, shows the preview of the connection type. The lower right section, labeled as **4**, shows the selection order, a brief description of the selection order, profiles that could be selected and the connection type.

FIGURE 11: THE CONNECTION VAULT

Connection Types

In Advance Steel, you can create various types of connection between the steel members. Some of these are listed below:

Base plate Joint

This type of joint is used to insert a base plate at the bottom of a vertical or inclined column. This joint type allows any section type to be used as the column. Figures 12 and 13 show various types of base plate joints.

FIGURE 12: THE BASE PLATE JOINT

FIGURE 13: BASE PLATE JOINT WITH STIFFENERS

Knee of frame bolted, with haunch Joint

This type of joint is created between the flange of a column and a beam and a haunch is created from the beam or from the plates. Figures 14, 15 and 16 show various types of joints of this category.

FIGURE 14: JOINT WITH ADDITIONAL RAFTER ALIGNED WITH THE PARENT RAFTER

FIGURE 15: TWO COLUMNS OF BOLTS INSERTED ON EACH SIDE OF THE RAFTER

FIGURE 16: SLOPED STIFFENER AND STANDARD STIFFENER 3 INSERTED

Clip Angle Joint

This type of joint is used to connect two beams or a beam and a column by inserting a clip angle between the two. You can use equal angles or unequal angles to insert. You can also decide to bolt the sections to the angles or weld them. Figure 17 shows the clip angle joint with cleats inserted on both sides.

FIGURE 17: CLIP ANGLE JOINT WITH CLEATS INSERTED ON BOTH SIDES

Single Side End Plate

This joint is used to connect a main beam or column to a secondary beam using an end plate. This end plate will be welded to the secondary beam and bolted to the main beam or column. Figure 18 shows this type of joint.

FIGURE 18: SINGLE SIDE END PLATE JOINT WITH SIX VERTICAL BOLTS IN GROUP 1 AND CENTER BOLT LAYOUT

Shear Plate Joint

This is one of the most commonly used joints and is used to connect a main beam to a secondary beam using a plate. This plate will be welded to the main beam and bolted to the secondary beam. Figures 19 and 20 show this type of joint.

FIGURE 19: SHEAR PLATE JOINT WITH A RECTANGULAR PLATE, THREE NUMBERS OF HORIZONTAL BOLTS AND TWO VERTICAL BOLTS IN GROUP 1

FIGURE 20: SHEAR PLATE JOINT THAT USES A PLATE WITH FLANGE ON BOTH SIDES, ONE NUMBER OF VERTICAL BOLT, AND THREE HORIZONTAL BOLTS IN GROUP 1

Adding Handrails to the Steel Model

In Advance Steel, you can use the Hand-railing tool to create various types of handrails. You can change the railing ends to meet your requirements and even define the post connection as welded or bolted. Figure 21 shows handrails with looped ends and post bolted and Figure 22 shows handrails with loop return ends and posts welded. Note that in both these figures, the handrails on the two sides of the stairs are created separately.

FIGURE 21: HANDRAILS WITH LOOPED ENDS

FIGURE 22: HANDRAILS WITH LOOP RETURN ENDS

Generating Fabrication Drawings

In Advance Steel, you can generate the assembly drawings, fabrication drawings, or erection drawings from parts or assemblies. This can be easily done using **Drawing Processes** palette shown in Figure 23.

FIGURE 23: THE DRAWING PROCESSES PALETTE TO GENERATE DRAWINGS

All the generated drawings are available in the **Document Manager** shown in Figure 24.

FIGURE 24: THE DOCUMENT MANAGER

Synchronizing Advance Steel Model with Autodesk Revit Changes

A very common issue that the structure detailers face is the Structural Engineers regularly modifying the original structure model. To cater to that issue, Advance Steel allows you to synchronize the Autodesk Revit model and import all the changes into your Advance Steel model, still maintaining all the connections in the model. To do this, simply export the modified Autodesk Revit model using the process shown in the earlier section of this handout. The following section shows how to synchronize the Advance Steel model.

1. In Advance Steel, from the **Export & Import** ribbon tab > **Revit** ribbon panel, click **Synchronize**, as shown in Figure 25.

FIGURE 25: SYNCHRONIZING THE AUTODESK REVIT MODEL

2. In the **Synchronization** dialog box, click the **Load** button and load the modified SMLX file that was exported from Autodesk Revit after modifying the model.
3. Expand the dialog box by clicking on the **Filter** button on the lower left corner, as shown in Figure 26.

*Tip: You can right-click on the **Status** column in the dialog box and select additional columns. For example, in Figure 25, the **Section** and **Section – File** columns are added using this method.*

FIGURE 26: THE SYNCHRONIZATION DIALOG BOX SHOWING ALL THE CHANGES

*Tip: It is extremely important to understand what are the changes listed in the dialog box. Sometimes, the changes are only showing the beam cut created in Advance Steel due to the joints that were created. However, if the **Change** column shows **Section**, in*

*addition to the other changes, it means the section of the member has been changed, as shown in the **Section – File** and **Section** columns in Figure 26.*

4. It is important to understand the color-coding of the items listed in the **Model object** column. The elements listed in the Blue color are modified, the elements listed in Red color are deleted, and the elements listed in Green color are new elements that were added. Select the **Status** tick box of all the changes you want to import and then click the **Apply All Actions** button in the dialog box; the Advance Steel model will be updated with the changes.

Validating Autodesk Revit Model against Advance Steel Model

The Structural Engineers are very particular about making sure the fabricated model has all the right sections that they used in the Autodesk Revit structure model. To make the process easier for the Structural Engineers, the Advance Steel add-in that was installed in Revit allows you to synchronize the Advance Steel model with the Revit model for design validation. The process of doing that is discussed next.

1. In Autodesk Revit, from the **Add-Ins** ribbon tab > **Advance Steel Extension** ribbon panel, click **Synchronization**, as shown in Figure 27.

FIGURE 27: VALIDATING THE AUTODESK REVIT STRUCTURE AGAINST ADVANCE STEEL MODEL MODEL

2. In the **Synchronization** dialog box, click the **Load** button and load the SMLX file that was exported from Advance Steel.
3. Expand the dialog box by clicking on the **Filter** button on the lower left corner. Clear the filter of the changes you do not want to see. For example, Figure 28 only shows the appended elements.

FIGURE 28: THE SYNCHRONISATION DIALOG BOX SHOWING THE APPENDED ITEMS

4. Select the status of all the elements you want to import into the Autodesk Revit model and click **Apply All Actions**; all the changes will be applied to the Autodesk Revit model.

Importing Autodesk Advance Steel Connections into Autodesk Revit Structure Model (For LOD 400 or above Jobs)

If you are a Structural Engineer working on LOD 400 or above jobs, you need to deliver fabrication level structural model. This model includes detailing, fabrication, assembly, and installation information. However, there are only a certain BIM software capable of delivering the fabrication level structural model. As a result, generally the structural detailers working under the fabricators are capable of working on the fabrication level model.

In recent years, there has been a shift in this industry and now certain structural engineers are starting to deliver the LOD 400 model. Especially, the projects in high seismic regions require the structural engineer of record to be involved in the connection designs and to give guidance to the fabricator. These engineers are generally who will take it to LOD 400. To make it easier for those structural engineers, Autodesk Revit 2018 allows you to create steel connections inside Revit. Alternatively, you can import the structural connections from Advance Steel straight into Autodesk Revit.

Downloading Steel Connection Add-In for Revit

As mentioned above, starting Autodesk Revit 2018, you can also add steel connections to the structural sections inside Autodesk Revit. You can also import the connections from Autodesk Advance Steel into Autodesk Revit. However, this functionality is not automatically delivered within the software. You need to download and install the Steel Connections for Autodesk Revit 2018 add-in for this functionality to be available. The following is the procedure for doing that.

1. Log on to your Autodesk account by going to <https://manage.autodesk.com/>.
2. Scroll down to Revit and click on Downloads, as shown in Figure 29.

FIGURE 29: DOWNLOADING THE ADD-IN

3. On the window that will open, click on Updates & Add-ons; the steel connection add-in will be displayed in the list, as shown in Figure 30.

FIGURE 30: THE ADD-IN AVAILABLE IN THE LIST

4. Download and install this add-in.
5. Start Autodesk Revit 2018 and open the structural model in which you want to add steel connections.
6. From the **Structure** tab, click on **Connection Settings**, as shown in Figure 31; the Structure Connection Settings dialog box will be displayed.

FIGURE 31: INVOKING THE STRUCTURAL CONNECTION SETTINGS DIALOG BOX IN AUTODESK REVIT

Tip: Although this dialog box displays a number of connections in the left pane, these connections will not be available for you to add to the structural sections. To make them available for use, you need to load them in the current file by double-clicking on them. However, if you are importing these connections from Autodesk Advance Steel, then you do not have to manually load them first. They will be automatically loaded as part of the import process.

7. In the **Available Connections** area of the dialog box, double-click on the connections that you want to add to the structural model; the connections will be displayed in the **Loaded Connections** area, as shown in Figure 32.

FIGURE 32: THE CONNECTION LOADED FOR USE

8. The loaded connections can now be added to the structural sections using the **Structure** ribbon tab > **Connection** ribbon panel > **Connection** tool.

Inserting Steel Connections in the Autodesk Revit Structure Model

After you have selected the connections you want to use in the dialog box shown in Figure 32 above, you are ready to insert these connections. The following is the procedure for doing this.

1. Select one or more steel sections to insert the connection and then from the **Structure** ribbon tab > **Connection** ribbon panel, click the **Connection** button, as shown in Figure 33. This figure also shows the column selected to insert the base plate connection.

FIGURE 33: SELECTING THE COLUMN TO INSERT THE BASE PLATE CONNECTION

2. From the **Properties** window, select **Generic Connection > Base Plate**, as shown in Figure 34.

Tip: Notice that although there is a base plate connection inserted at the bottom of the column, but you cannot see it. This is because the visibility of the connection elements is turned off by default. The next section will explain how to turn on the visibility of the connection.

FIGURE 34: SELECTING THE **BASE PLATE** CONNECTION FOR THE COLUMN

3. In the **Properties** window, click the **Edit** button on the right of **Modify Parameters** to modify the parameters of the connection.

Turning on the Visibility of the Connection Elements

As mentioned above, by default, the display of connection elements is not turned on in Autodesk Revit. You will now turn on the visibility of these elements.

1. Type **VG**; the **Visibility Graphic Override for 3D View** dialog box is displayed.
2. Expand the **Structural Connections** category and select all the items in that category, as shown in Figure 35.

FIGURE 35: TURNING ON THE VISIBILITY OF THE CONNECTION ELEMENTS

3. Click OK in the dialog box.
4. Notice that only the connection symbols are displayed in the model, as shown in Figure 36. However, the connection elements are still not displayed. This is because to display the connection elements, you need to change the **Detail Level** to **Fine**.

FIGURE 36: CONNECTION ELEMENTS DISPLAYED AS SYMBOLS

5. Change the **Detail Level** of the model visibility to **Fine**; all the connection elements are displayed in the model.
6. Navigate close to various joints and notice the connection elements in the model. Figure 37 shows a zoomed in view of the model showing various connections.

FIGURE 37: THE CONNECTION ELEMENTS DISPLAYED AFTER TURNING THEIR VISIBILITY ON

Importing Steel Connections from Advance Steel into Autodesk Revit

As mentioned above, you can also import steel connections directly from the Advance Steel model into Autodesk Revit. The process of doing that is discussed next.

1. In Autodesk Revit, from the **Add-Ins** ribbon tab > **Advance Steel Extension** ribbon panel, click **Synchronization**, as shown in Figure 38.

FIGURE 38: INVOKING THE **SYNCHRONIZATION** DIALOG BOX

2. In the **Synchronisation** dialog box, click the **Load** button and load the SMLX file that was exported from Advance Steel model that had all the connections.
3. Expand the dialog box by and clear the filter of all the changes, except **Connections** and **Appended**, as shown in Figure 39.

FIGURE 39: THE SYNCHRONISATION DIALOG BOX SHOWING THE APPENDED CONNECTIONS

4. Select the status of all the connections and click **Apply All Actions**; all the changes will be applied to the Autodesk Revit model. Figure 40 shows the zoomed in view of the model with some connections.

Tip: Remember to turn on the visibility of the connection elements, as discussed in the previous section, to be able to view the connections in the model.

FIGURE 40: THE ZOOMED IN VIEW OF THE AUTODESK REVIT MODEL WITH CONNECTIONS
